

PROBLEM STATEMENT: INTELLIGENT CONSUMER COMPLAINT CLASSIFICATION

BY TEAM UPEMBAPARK

Customers, support agents, and businesses alike are burdened by the flood of unstructured complaints that overwhelm support systems every day. Keyword-based routing fails to capture the nuance, emotion, and urgency behind real grievances, leaving customers waiting longer for help and agents buried in manual triage. Left unresolved, this drives customer churn, reputational damage, rising operating costs, and, most seriously, delayed responses to genuinely urgent cases like fraud or safety concerns. Our team is building an AI-powered complaint classification pipeline, using a fine-tuned transformer model to accurately categorize and prioritize complaints, freeing agents to focus on resolution rather than sorting. The solution is guided by privacy, ensuring sensitive data is protected; fairness, regularly auditing model performance across different complaint types to catch and correct disparities; and liberty, keeping humans in the loop for high-stakes decisions. The goal is faster, more reliable support that restores trust between customers and the businesses meant to serve them.
